Reading and Writing Data

readr and haven

2020-09-22

readr

Function	Reads
read_csv()	Comma separated values
read_csv2()	Semi-colon separate values
read_delim()	General delimited files
read_fwf()	Fixed width files
read_log()	Apache log files
read_table()	Space separated files
read_tsv()	Tab delimited values

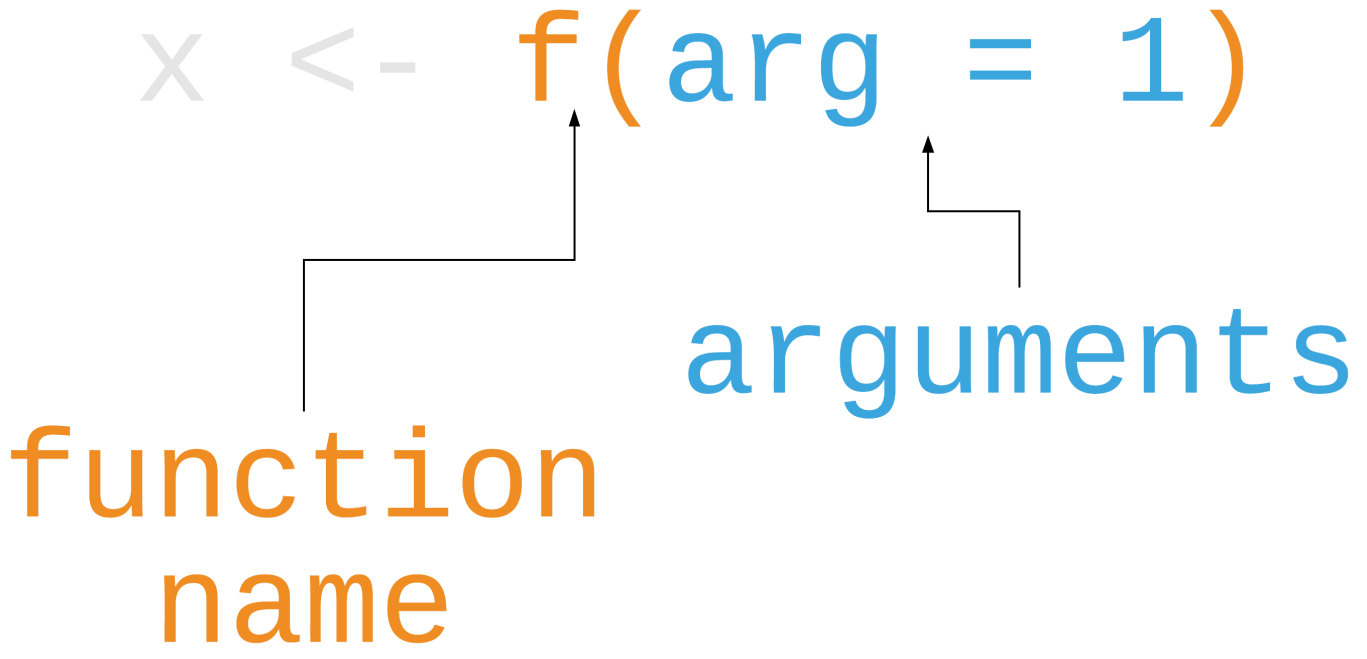
Importing Data

```
dataset <- read_csv("file_name.csv")
dataset
```

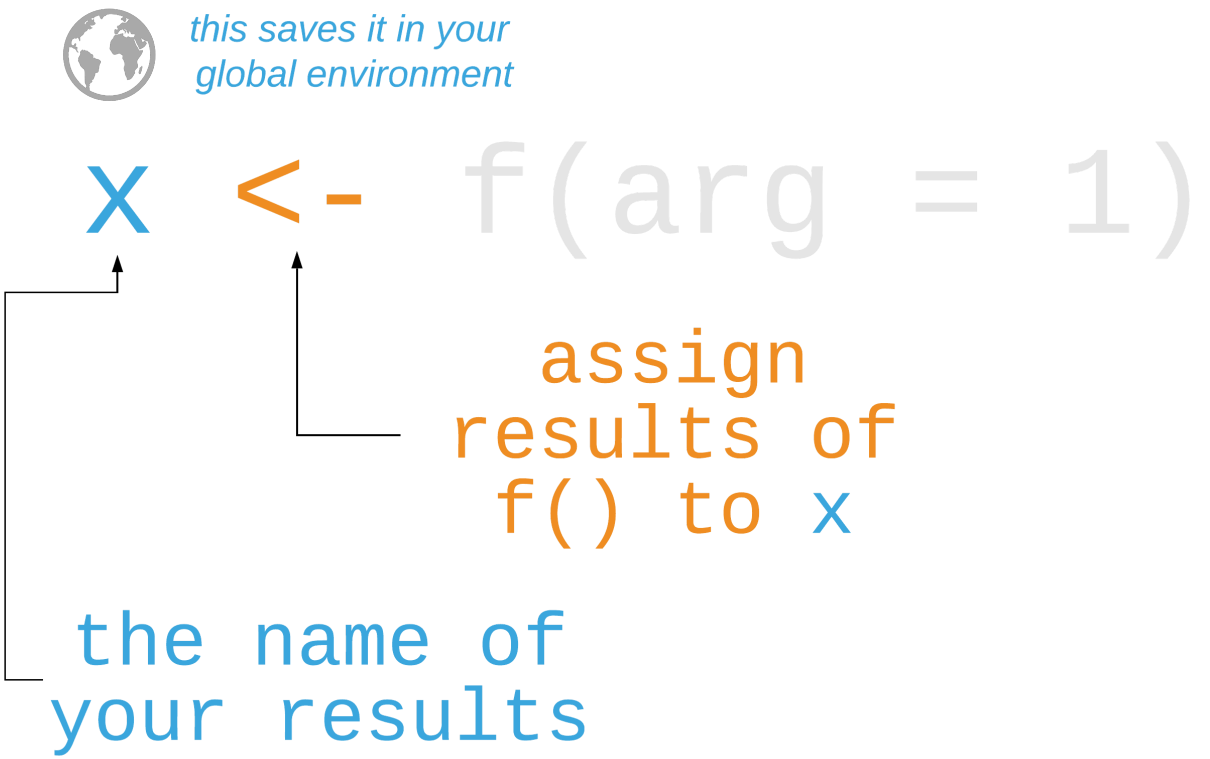
R functions

```
x <- f(arg = 1)
```

R functions



R functions



this saves it in your
global environment
x <- f(arg = 1)
assign
results of
f() to x
the name of
your results

Your Turn 1

Find diabetes.csv on your computer. Then read it into an object. Then view the results.

Your Turn 1

Find diabetes.csv on your computer. Then read it into an object. Then view the results.

```
diabetes <- read_csv("diabetes.csv")
```

new data alert!

diabetes

	id	chol	stab.glu	hdl	ratio	glyhb	location	age	gender	height	weight	frame	bp.
1	1000	203	82	56	3.6	4.31	Buckingham	46	female	62	121	medium	118
2	1001	165	97	24	6.9	4.44	Buckingham	29	female	64	218	large	112

9	1016	177	87	49	3.6	4.84	Buckingham	45	male	69	166	large	160
10	1022	263	89	40	6.6	5.78	Buckingham	55	female	63	202	small	108
11	1024	242	82	54	4.5	4.77	Louisa	60	female	65	156	medium	130
12	1029	215	128	34	6.3	4.97	Louisa	38	female	58	195	medium	102
13	1030	238	75	36	6.6	4.47	Louisa	27	female	60	170	medium	130
14	1031	183	79	46	4.0	4.59	Louisa	40	female	59	165	medium	NA
15	1035	191	76	30	6.4	4.67	Louisa	36	male	69	183	medium	100
16	1036	213	83	47	4.5	3.41	Louisa	33	female	65	157	medium	130
17	1037	255	78	38	6.7	4.33	Louisa	50	female	65	183	medium	130
18	1041	230	112	64	3.6	4.53	Louisa	20	male	67	159	medium	100

Where does it come from?

diabetes.csv (etc)
study: diabetes in African Americans

How can I use it?

```
diabetes <-
 readr::read_csv("diabetes.csv")
View(diabetes)
```

this saves it in your global environment

```
diabetes
```

```
## # A tibble: 403 x 19

```

Tibbles

data.frames are the basic form of rectangular data in R (columns of variables, rows of observations)

Tibbles

data.frames **are the basic form of rectangular data in R (columns of variables, rows of observations"**

read_csv() **reads the data into a** tibble**, a modern version of the data frame.**

Tibbles

data.frames **are the basic form of rectangular data in R (columns of variables, rows of observations"**

read_csv() **reads the data into a** tibble**, a modern version of the data frame.**

a tibble is a data frame

Missing values

It's common to use codes for **missing values** (-99, 8888)

Missing values

It's common to use codes for missing values (-99, 8888)

The na option can change these values to NA

```
read_csv(
  "a,b,c,d
  1,-99,3,4
  5,6,-99,8",
  na = "-99"
)
```

```
## # A tibble: 2 x 4
##       a     b     c     d
##   <dbl> <dbl> <dbl> <dbl>
## 1     1    NA     3     4
## 2     5     6    NA     8
```

Parsing data types

The read functions in readr try to **guess** each data type, but sometimes it's **wrong**

Parsing data types

The read functions in readr try to guess each data type, but sometimes it's wrong

To tell readr how to parse the columns, add the argument col_types **to** read_csv()

Parsing data types

The read functions in readr try to guess each data type, but sometimes it's wrong

To tell readr how to parse the columns, add the argument col_types to read_csv()

```
diabetes <- read_csv(
  "diabetes.csv",
  col_types = list(id = col_character())
)
```

Parsing data types

Or use a string for each variable type:

col_type = "cci"

Parsing data types

Or use a string for each variable type:

col_type = "cci"

letter	type
c	character
i	integer
n	number
d	double
l	logical
D	date
T	date time
t	time
?	guess the type
_ or -	skip the column

Your Turn 2

Set the 4 column types to be: integer, double, character, and unknown (guess)

```
read_csv(
  "a,b,c,d
  1,2,3,4
  5,6,7,8",
  col_types = ""
)
```

Your Turn 2

Set the 4 column types to be: integer, double, character, and unknown (guess)

```
read_csv(
  "a,b,c,d
  1,2,3,4
  5,6,7,8",
  col_types = "idc?"
)
```

```
## # A tibble: 2 x 4
##       a     b c         d
##   <int> <dbl> <chr> <dbl>
## 1     1     2 3         4
## 2     5     6 7         8
```

haven

Function	Software
read_sas()	SAS
read_xpt()	SAS
read_spss()	SPSS
read_sav()	SPSS
read_por()	SPSS
read_stata()	Stata
read_dta()	Stata

haven

Function	Software
read_sas()	SAS
read_xpt()	SAS
read_spss()	SPSS
read_sav()	SPSS
read_por()	SPSS
read_stata()	Stata
read_dta()	Stata

haven is not a core member of the tidyverse. That means you need to load it with library(haven)**.**

Your Turn 3

There are several versions of the diabetes file besides CSV. Pick a file format you or your colleagues use and import them using the corresponding function from haven.

Your Turn 3

```
library(haven)
diabetes <- read_sas("diabetes.sas7bdat")
```

Your Turn 3

```
diabetes
```

```
## # A tibble: 403 x 19
##       id  chol stab_glu   hdl ratio glyhb location   age
##    <dbl> <dbl>    <dbl> <dbl> <dbl> <dbl> <chr>    <dbl>
##  1  1000   203       82    56  3.60  4.31 Bucking~    46
##  2  1001   165       97    24  6.90  4.44 Bucking~    29
##  3  1002   228       92    37  6.20  4.64 Bucking~    58
##  4  1003    78       93    12  6.5   4.63 Bucking~    67
##  5  1005   249       90    28  8.90  7.72 Bucking~    64
##  6  1008   248       94    69  3.60  4.81 Bucking~    34
##  7  1011   195       92    41  4.80  4.84 Bucking~    30
##  8  1015   227       75    44  5.20  3.94 Bucking~    37
##  9  1016   177       87    49  3.60  4.84 Bucking~    45
## 10  1022   263       89    40  6.60  5.78 Bucking~    55
## # ... with 393 more rows, and 11 more variables:
## #   gender <chr>, height <dbl>, weight <dbl>, frame <chr>,
## #   bp_1s <dbl>, bp_1d <dbl>, ...
```

Writing data

Function	Writes
write_csv()	Comma separated values
write_excel_csv()	CSV that you plan to open in Excel
write_delim()	General delimited files
write_file()	A single string, written as is
write_lines()	A vector of strings, one string per line
write_tsv()	Tab delimited values
write_rds()	A data type used by R to save objects
write_sas()	SAS .sas7bdat files
write_xpt()	SAS transport format, .xpt
write_sav()	SPSS .sav files
write_stata()	Stata .dta files

Writing data

write_delim()	General delimited files
write_file()	A single string, written as is
write_lines()	A vector of strings, one string per line
write_tsv()	Tab delimited values
write_rds()	A data type used by R to save objects
write_sas()	SAS .sas7bdat files
write_xpt()	SAS transport format, .xpt
write_sav()	SPSS .sav files
write_stata()	Stata .dta files

```
write_csv(diabetes, path = "diabetes-clean.csv")
```

Your Turn 4

R has a few data file types, such as RDS and .Rdata. Save diabetes **as "diabetes.Rds".**

Your Turn 4

R has a few data file types, such as RDS and .Rdata. Save diabetes as "diabetes.Rds".

```
write_rds(diabetes, "diabetes.Rds")
```
